

Acknowledgements

Foremost I would like to thank **Alfred Hirn** for giving me the opportunity to accomplish this study and for patiently supervising me during my PhD. He enhanced my understanding of seismogram interpretation and tomography. He encouraged me with long and fruitful discussions. I am deeply impressed by his anytime-support and his enthusiasm for science. Many thanks to my adviser **Sebastiano Imposa** for his scientific support and suggestions and to **Stefano Gresta** for being always ready to help me in any way.

Moreover, I would like to thank the group of the “Laboratoire de sismologie expérimentale” of the “Institut Physique du Globe de Paris”, especially **Anne Becel**, **Martine Sapin** and **Mireille Laigle**, since this work profited a lot from our interesting discussions and the many new impulses that I received from them.

I also wish to thank the colleagues of “Istituto Nazionale di Geofisica e Vulcanologia”, who are kindly acknowledged for providing additional software facilities. I wish to especially thank **Luciano Scarfi** and **Horst Langer** for continuous help whenever I had problems. I am thankful to my colleagues **Christian Anténor-Habazac** and **Francois Beauducel** for the help and support during my stay at the “Observatoire Volcanologique et Sismologique de la Guadeloupe” (French West Indies).

This work has been carried out with the temporary land seismometers from instrument pools of “Institut National des Sciences de l’Univers”, “Institut Physique du Globe de Paris”, “Consejo Superior de Investigaciones Científicas”, “Géoazur-Institut de recherche pour le Développement” and “Institute of Seismology and Volcanology of Hokkaido” deployed in the frame of the SISMANTILLES I cruise of N/O Le Nadir of Ifremer (PI Alfred Hirn). The author of this thesis benefited from grants (year 2009) of Research Office of the University of Catania.
